Energy Blast

Fort Worth Museum of Science and History
Fort Worth, Texas

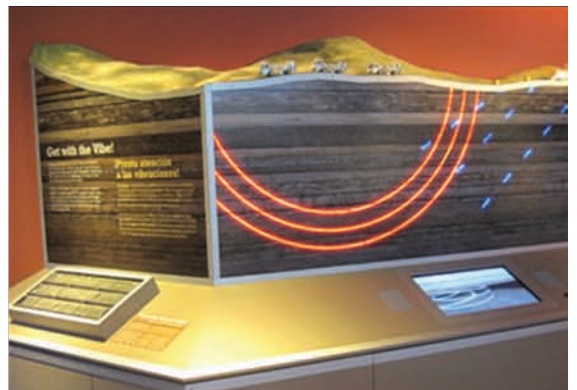

Energy Blast tells the story of energy resources in North Texas through a unique combination of science and history, bringing physics, technology, and innovative thinking to life as guests explore geophysical formations, calculate drilling depths and directions, and experiment with new resources. Design Island developed and produced the multi-media for this new exhibit which opened at the Fort Worth Museum of Science and History in the fall of 2009.

Six projectors were used to create an immersive, prehistoric, underwater environment for guests as they embark on their incredible journey. A 4D theatre experience presents the history of the natural gas and oil industry in an exciting time travel show.

Through interactive exhibits, multimedia, dioramas, and learning stations, Energy Blast provides immersive multi-media that allows guests to visit the platform of a natural gas rig, work with alternative and conventional energy sources to power a city, and discover the different stages of energy exploration. Design Island worked in close collaboration with industry experts and the Museum's internal team to create this energizing exhibit.
